

Green Streets in New Jersey

A green street uses green infrastructure to manage stormwater runoff while also providing a safe and accessible route for all users. Green streets are designed to capture rainwater where it falls. In contrast, traditional streets are designed to direct stormwater runoff from impervious surfaces into storm sewer systems (gutters, drains, pipes) that discharge directly into surface waters, rivers, and streams. This carries pollution into waterways, whereas green infrastructure filters pollutants out. Green streets incorporate types of green infrastructure like permeable pavements, stormwater planters, tree pits, bioswales, rain gardens, and curb bump-outs. These tools can be placed along sidewalks, bike lanes, vehicle lanes, road shoulders, and in parking spaces.

Here is a list of green street projects in New Jersey.

Have a green street project we should include?
